« (% w/v) ».

Abstract
In this study, taking advantage of a DGE’s (dynamic geometry environment) affordances, we designed a unit of educational material in respect of an interdisciplinary framework, referring to Chemistry and Mathematics and we used it in classroom. The concepts that we aimed to involve students with were the “percentage of solution (%w/v)” in relation to the “slope of a line”. Through mathematization of chemistry problems and the use of multiple representations, our goal was the elaboration and the deeper understanding of the underlying concepts by the students, and the fostering of making connections between these concepts, in a broader sense of cross-curricular learning environment.
